

# Design, Implement, and Continually Improve an Asset Management System

An Asset Management System is a game plan for asset management. It consists of the practices, processes and procedures used by an organization to achieve its objectives. An Asset Management System is not software – however, it helps make software perform.

We help organizations design, implement and continually improve Asset Management Systems. Our domain expertise, ISO 55000 credentials, and proprietary content can build, deploy, and improve a high performance ISO 55000 compliant Asset Management System for your organization.

## An Asset Management System Will Make Your Existing EAM, CMMS, or ERP System Successful

We understand the challenges. It's difficult to obtain rich and actionable information, and you may have spent a substantial amount of money on software that offered limited returns. Also, your business processes may not be optimized, which can have a dramatic impact on your company's operations. An Asset Management System will solve these challenges.

To assist in the development of your system, we utilize the industry's most extensive library of accepted improvement practices. Our library helps you develop a better system faster.

Embedding an Asset Management System into your operation requires training, auditing, change management, and even marketing. We'll work closely with you, leading the effort every step of the way. We help make best practices an organizational habit.

### Asset Management System Benefits

- ① Establishes best practices based on industry standards (ISO 55001 & PAS 55)
- ② Optimizes ROI for physical assets and software (i.e. EAM, CMMS, ERP, etc.)
- ③ Improves risk management, HSE performance, and corporate governance
- ④ Boosts the bottom line by increasing productivity while reducing costs

### SwainSmith's Asset Management System Services Help You:
